

Instructions for use

airdry car dehumidifier DUO

Operation manual

The pouches of the airdry DUO consist of a fleece upper side, which becomes perceptibly damp by absorbing moisture, and a foil underside, which prevents moisture transfer downwards. Place the bags with the foil side down in suitable places in the car. For best results, while the car is parked, place the bags at the front left and right near the windscreen. Saturation of maximum 1.1 kg per bag is determined by weighing.

Product contains salt - avoid eye contact.

Regeneration

The airdry DUO can be dried on a heater for reuse. The cushion releases its moisture over a longer period of time, which can be days or weeks depending on saturation and heating. Drying to a weight of approx. 700 g per bag can be expected.

How it works

Like a magnet, the airdry DUO draws moisture from the air of your vehicle's interior, which is stored in the active granulate. The airdry DUO can be distributed efficiently in the car due to its two bags and is therefore the TURBO among car dehumidifiers. We recommend placing it inside the car at the same time, preferably near the front window.

In vehicles, extreme climate changes occur in a matter of minutes due to breathing air, ventilation, heating, air conditioning and external conditions such as rain and sunlight, which often leads to fogged windows. The airdry DUO reacts to this by constantly absorbing excess water from the air. The windows become clear again after some time or do not mist up at all.

Up to 1000 ml of water is absorbed evenly. Depending on the size of the car, the temperature and the prevailing humidity, the airdry DUO is effective for about 5 months. Then regeneration is necessary.
